Introduction to MATLAB bootcamp

Week 2 Lecture 3

Sandeep Kumar sk35@princeton.edu

Selecting an element by index in a 2D matrix

big_mat_eg=[1 2 3 4; 5 6 7 8; 9 10 11 12];

Column 2

Column 3

Column 1

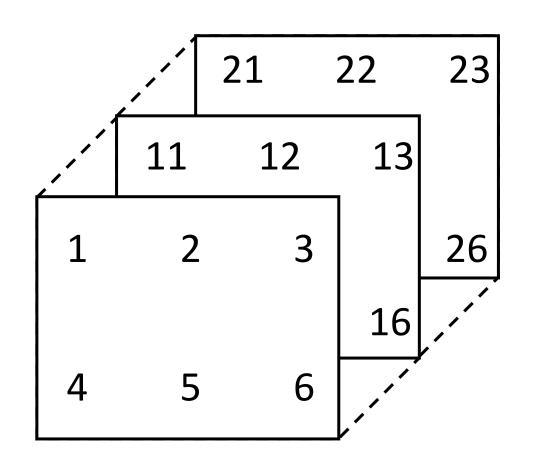

Row	1
Row	2

Oolulliii i		1 0				Joidinin 5		
1	1	2	4	3	7	4	10	
5	2	6	5	7	8	8	11	
9	3	10	6	11	9	12	12	

3 Dim matrix (can then be generalized to N Dim)

What will be a good example of a 3 dim matrix?

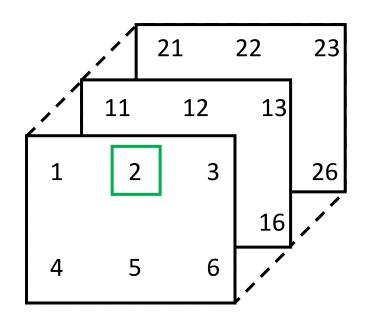

```
three_dim_mat(:,:,1)=[1 2 3; 4 5 6];
three_dim_mat(:,:,2)=[11 12 13; 14 15 16];
three_dim_mat(:,:,3)=[21 22 23; 24 25 26];
>> three dim mat(4) >> three dim mat(9)
ans =
                      ans =
                      12
```

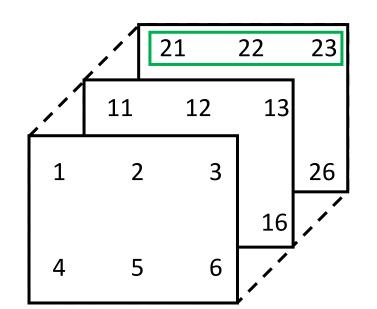

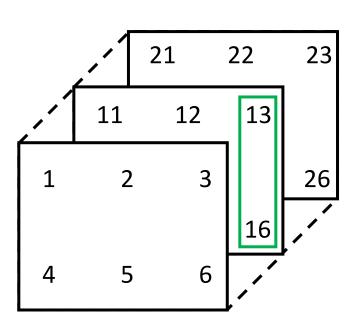

3 Dim matrix (can then be generalized to N Dim)

>>three_dim_mat(1,2,1) >> three_dim_mat(1,:,3) >> three_dim_mat(:,3,2)

ans = ans = 13 5 21 22 23 16

```
>> vector_1=[2:7]
To define a matrix:
                                                            vector_1 =
matrix_name=[start_value : step_value : end_value];
                                                                                  5
                                                            >> only_odd_numbers=[1:2:13]
                                                            only_odd_numbers =
                                                                                   7
                                                                                              11
                                                            >> descending_even_numbers=[14:-2:2]
                                                            descending_even_numbers =
```

Another way to define a matrix is to use the function linspace/linearly spaced vector

(https://www.mathworks.com/help/matlab/ref/linspace.html)

matrix_name=linspace(start_num, end_num, num_elements)

Here is an example to generate an array with 7 elements between -3 and 3 (including both of them).

```
>> test=linspace(-3,3,7)
test =
-3 -2 -1 0 1 2 3
```

You can use built-in functions to define matrices. For e.g.

- 1. To generate matrix with all 1s: ones(num_row, num_column)
- 2. To generate matrix with all 0s: zeros(num_row, num_column)
- 3. To generate matrix with all NaNs: nan(num_row, num_column)

>> ones(2,3)	>> zeros(2,4)	>> nan(2,2)		
ans =	ans =	ans =		
1 1 1 1 1 1	0000	NaN NaN NaN NaN		

To generate matrix with random numbers: rand(num_row, num_col)

To generate matrix with random integers: randi(max_integer,num_row, num_col)

```
>> randi(9,2,3)
ans =

How will you get random
positive and negative integers?
3 4 2
8 9 3
```

Matrix operations: Addition and subtraction

```
>> mat_1=[6:2:10;20:-2:16]
```

>> mat_2=[3:5;-5:-3]

mat_1 =

6 8 10 20 18 16

mat 2 =

3 4 5 -5 -4 -3 >> mat_add=mat_1+mat_2

mat_add =

9 12 15

15 14 13

>> mat_add=mat_1-mat_2

mat add =

3 4 5

25 22 19

Matrix operations: Scalar multiplication

```
>> mat_3=[1:2:5; 5:-2:1]
>> scalar 3=5
>> scalar_mult=mat 3*scalar 3
```

```
>> mat_3=[1:2:5; 5:-2:1]
scalar_3=5
scalar_mult=mat_3*scalar_3
mat_3 =
scalar_3 =
scalar_mult =
                25
    25
```

Matrix operations: Matrix (or vector) multiplication

Keep in mind the dimension of the two matrices for vector multiplication

$$[A]_{mxn} X [B]_{nxm} = [C]_{mxm}$$

For example:

```
>> mat_4=[3:5; 5:7]
>> mat_5=[2:3; 4:5; 6:7]
>> vector_mult=mat_4*mat_5
```

Matrix operations: Element by element multiplication

Both the matrices should be of the same size.

For example:

```
>> mat_6=[3:5; 5:7]
```

>> element_by_element_mult=mat_6.*mat_7

Matrix operations: Transpose of a matrix

Flips the dimensions of the matrix

$$[A]_{mxn} \rightarrow [B]_{nxm}$$

Splitting matrices

• Sometimes you might want to split the matrix and work on a subset of the matrix (for e.g. just a row or column)

```
>> original_mat=[1:7; 21:27; 51:57]
    >> split_row=original_mat(2,:)
    >> split column=original mat(:,4)
                                   >> split column =
>> split row =
21 22 23 24 25 26 27
                                   24
                                   54
```

Concatenating matrices: Horizontal

- Combine two matrices horizontally
- If you have 2 matrices A and B then to horizontally concatenate them:
- C=[A B] or C=horzcat(A, B)

```
>> mat_10=ones(3,2)*4
>> mat_11=randi(7,3,2)
>> horz_cat_1=[mat_10 mat_11]
>> horz_cat_2=horzcat(mat_10,mat_11)
```

```
_1=[mat_10 mat_11]
_2=horzcat(mat_10,mat_11)

>> horz_cat_1 =
```

7 5

Concatenating matrices: Vertical

- Combine two matrices vertically
- If you have 2 matrices A and B then to horizontally concatenate them:
- C=[A; B] or C=vertcat(A, B)

4 4 4

7 6 3

4 4 4

7 6 3

mean of an array

```
>> new_matrix=[2:2:16; 10:-2:-5; 3:3:24];
```

What if you want to find the mean across each row?

2	4	6	8	10	12	14	16
10	8	6	4	2	0	-2	-4
3	6	9	12	15	18	21	24

mean(new_matrix,2)

sort

• To sort an array, you can use the inbuilt MATLAB function sort

```
• mat_14=[10 5 2 3 6 7 0 -1 -12 7 6]
```

```
• sort(mat_14)
```

ans =

-12 -1 0 2 3 5 6 6 7 7 10

unique

- Sometimes your goal is to find the unique elements in an array
- For e.g. in the previous example 6 and 7 appeared twice.
- To find the unique elements, use the function 'unique'.

- mat_14=[10 5 2 3 6 7 0 -1 -12 7 6]
- unique(mat_14)
- ans =

-12 -1 0 2 3 5 6 7 10

Note that the 'unique' function also sorts the output

reshape

• Using reshape function, we can reshape a matrix to another size

```
to_reshape_array=[1:1:10]
```

reshape(to reshape array)

```
• ans =
```

- 1 6 2 7 3 8 4 9
